Lab 1

Semantic HTML Scaffold

Detail	Value
Student name	Haseeb Alam
Roll number	SP24-BCS-142
Course	Web Development
Submission folder	lab-1/
Deliverables	index.html, Lab-1-Completion.docx

1. Overview

This lab builds a semantic HTML5 skeleton for a generic e-commerce homepage called ShopEasy. The page uses no CSS and no JavaScript; its only purpose is to practise correct document structure with landmark elements, a proper heading outline, lists for navigation and links, and an accessible form.

2. Page Structure

Element	Contents
header	Site name link and nav (aria-label="Main navigation") with 5 anchor links
main > section#featured-products	h1 "Featured Products" and four product article elements, each with an h2, description, price in a data element and a link
main > section#categories	h2 "Shop by Category" and a list of six category links
main > section#newsletter	h2 "Subscribe to Our Newsletter" and a form with a labelled email input (type="email", required) and a submit button
footer	Three groups (Shop, Customer Support, Company), each with an h2 and a list of four links, then a small copyright line

Semantic choices: every section is linked to its heading with aria-labeled; the label is tied to the input with for/id; ampersands are escaped as & the document has a single h1 and a consistent h2/h3 hierarchy.

3. W3C Validation

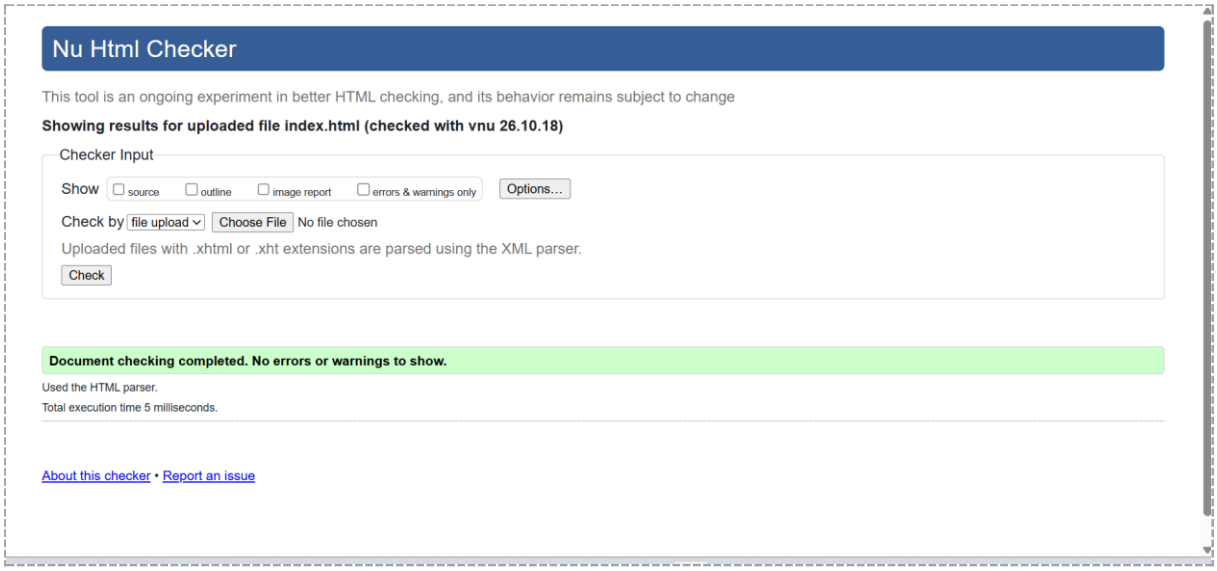

The page was checked with the Nu HTML Checker, the same engine that powers validator.w3.org (version 26.10.12), run locally against index.html:

```
$ java -jar vnu.jar --also-check-css index.html
(no output)
exit code: 0
```

The checker prints nothing when a file has no errors or warnings. The official W3C Validator displays this as:

Document checking completed. No errors or warnings to show.

Official validator screenshot:

5. Rendered Page (unstyled)

Browser rendering of index.html with default styles only, as required for this lab.
